1 Question 1

1.1 Part (i)

Write your answer here. State assumptions clearly and show the main steps of your derivation.

For example, an inline expression is $y = \beta x + \varepsilon$, and a displayed equation is

$$\max_{q \geq 0} \pi(q) = p(q)q - C(q).$$

1.2 Part (ii)

Write your answer here.

If you use code to produce a result, describe the method and interpret the output in the text. Keep supporting code in `pset_1/code/`.

```
# Example: code used for a calculation or figure.  
# import pandas as pd  
# data = pd.read_csv("temp/scenario_1.csv")
```

2 Question 2

2.1 Part (i)

Write your answer here.

2.2 Part (ii)

Write your answer here.

3 Appendix (optional)

Place supplementary derivations, tables, or figures here.
